

BASC 523 May 2026 Supply Chain Management Exam Guidelines

The exam will have 7 questions. You should be able to finish in 2 hours with time to spare if you know the material. Of these 5 questions will involve either direct calculations or formula/model based answers that may not involve calculations but understanding and applying the intuition from formulas.

You will have to know the key points in the cases we discussed, not the nitty gritty details!
Examples of a case based question you should be answer –

- *Using the insights from playing the beer game and otherwise (case discussion), give 4 distinct and first order reasons why the Barilla supply chain suffered from bull whip.*
- *Wriston manufacturing evaluated the Detroit plant poorly and contemplated moving its products to higher volume factories. What may be two important reasons as to why this can be problematic.*

Examples of case based questions I will **NOT** ask –

- *What are the different types of online grocery models we discussed during the HEMA case discussion.*
- *Where did SHEIN locate its suppliers?*

It would help you to review the high level ideas on the financial analysis we did when we de briefed some of the cases. You will not be asked extensive calculations based on NPV and such. Some of the ratios we covered that are used in supply chains is fair game to test.

You are allowed a cheat sheet – standard paper both sides filled up. Us it wisely.

Good Luck!
